

EXTRACTVALIDATEAUDITIDP AT SCALE

Every field, every document, traced back to the page.

Any document or scan becomes clean, validated, structured data — every value anchored to its exact place on the source page and cross-checked by a deterministic verifier.

INDUSTRIES	WORKS WITH	BUILT FOR
All industries	Amazon Textract · PDF & scans · Master data	Shared services & operations heads · Finance & AP leaders · Banking, insurance & NBFC ops · Logistics & trade documentation teams

Page-anchored EVERY VALUE LINKED TO SOURCE COORDINATES	Scale, cost-effectively MACHINE-SPEED THROUGHPUT AT A FRACTION OF MANUAL COST	Immutable log EVERY ACTION RECORDED FOR AUDIT & REPLAY
--	---	--

Built so the output can be verified, field by field.

EVIDENCE Page-anchored values Every field the model returns is linked back to its exact bounding box and coordinates on the source page, so each value can be traced to its origin.	CONTROL Deterministic verification A rule-based verifier cross-checks every field — arithmetic, format, master-data — independently of the model, before the data reaches your systems.	ACCOUNTABILITY Immutable audit log Every extraction, correction and approval is written to a tamper-evident log that supports full replay for audit.
---	---	--

Cost-effective, intelligent document processing at scale Any document or field, PDF or scan, in — anchored to its exact place on the source page via Textract OCR — clean, structured, validated data out.

COST-EFFECTIVE, INTELLIGENT DOCUMENT PROCESSING AT SCALE		
IN Any document or field, PDF or scan	ANCHORED To its exact place on the source page via Textract OCR	OUT Clean, structured, validated data at high throughput

How it runs

01 Extract Amazon Textract OCR reads text, tables and form fields from any document type or scan quality.	02 Anchor Every extracted value is mapped back to its exact bounding box on the source page.	03 Validate A deterministic, rule-based verifier cross-checks each field against expected logic.	04 Audit Every extraction, correction and approval is written to an immutable audit log.
---	--	--	--

What you get

- › Any document or field — PDF or scan — into clean, structured data
- › A deterministic verifier checking arithmetic, format and master-data
- › An immutable, tamper-evident log of every extraction, correction and approval
- › Every value anchored to its exact coordinates on the source page
- › Machine-speed throughput at a fraction of manual processing cost
- › Full replay for audit, field by field

INCLUDED FREE · DEMO + POC · ONE DOCUMENT TYPE · YOUR SAMPLE SET · NO COST

Send us a sample set — see the extraction on your own documents.

HOW IT RUNS

- You pick one document type and send a representative sample
- We configure extraction, verification rules and the field schema
- You see page-anchored output and the verifier's findings, field by field

WHAT YOU PROVIDE

- A sample set of one document type (redacted is fine)
- The target field schema, or your current manual template
- A contact who knows the current exception cases

WHAT YOU GET BACK

- Structured output for your sample, with every field page-anchored
- A field-level accuracy and exception report
- A throughput and cost-per-document estimate at your volume
